

Recitation Week 4 Problems

- 1) Import the premier league player stats dataset: first save the .csv file to your computer. Then copy the pathname. Next use `read_csv` to read in from that filepath. Save the dataset as a tibble
- 2) Print out the column names - what are the variables? is this data in long or wide format?
- 3) Using a pipe, find the average player height during the first game week? During the second? Is there a way you could calculate the average height on each week and display them all at once? using one command?
- 3) Transpose the data into wide format using `pivot_wider()`
